- Recommended for sectioning the conduits preventing the flame propagation either from a part of the installation to another one or from an enclosure to another one.
- Side opening for pouring cold locking mixture CRV 420.
- Series EZS ... is suitable for both VERTICAL and HORIZONTAL piping, while series EYS ... is suitable **only** for VERTICAL piping.
- The sealing joints assume the temperature class of the apparatus on which they are installed.

Options - Material: Stainless Steel. - Other threadings (Metric ISO 262 M..x1,5).

The size and the maximum number of conductors in the following tables refer to the type N07V-K with PVC insulation quality R2. The conductors type N07V-K comply with the national standards CEI 20-35 (CENELEC HD 405-1), CEI 20-22 CEI 20-37 II and I.

As alternative, the conductors may have different isolation (gommapprene, neoprene, etc..) providing they conform to CENELEC for nominal characteristics and mode of use.

In any case, the maximum number of conductors referred to the same section for the same diameter will be determined by observing the dimension "y" in the tables in the preceding page.

The same sealing joint can be used with wires of different section as long it is respected the "y" dimension of the sealing joint under consideration.

Instructions for making the sealing of the joints series EZS ...

1. Remove the cap.
2. Prepare with the utmost care a "stuffing box" so that the resin does not enter in conduits or equipment. The stuffing box can be arranged by cramming the specific fiber type FCE in the interstices between the conductors and the sealing joint and/or between conductor and conductor observing the dimension "y".
The stuffing box is only necessary for the lower entry when the coupling is in a vertical position; in both entries when it is in a horizontal position.
3. Retighten the cover place vertically the entry.
4. Prepare the resin CRV 420 in sufficient quantity to seal the joint and/or to ensure a duration of 30 minutes.
5. Pour the resin to almost touch on the thread.
6. Screw the cap and tighten.
7. After having poured the resin do not move or stress the conductors for at least 24 hours for joints up to 1" and for at least 48 hours for greater sizes.
